

* Generative model Basic

- GAN :

- loss $\rightarrow$ Generator loss + Discriminator loss

- 문제 : mode collapse / non-convergence

$\hookrightarrow$ discriminator가 너무 잘 작동

- VAE :

$\rightarrow$ encoder는 μ, σ 만

- goal: $p(x)$ 만들기

$$p(x) = \int p(x, z) dz$$

$$\begin{aligned} \rightarrow \log p(x) &= \log \int p(x, z) dz \\ &= \log \int p(x, z) \cdot \frac{q_\phi(z|x)}{q_\phi(z|x)} dz \\ &= \log \mathbb{E}_{z \sim q_\phi} \left[\frac{p(x, z)}{q_\phi(z|x)} \right] \end{aligned}$$

$$\xrightarrow[\text{ELBO}]{\text{Lower}} \geq \mathbb{E}_{z \sim q_\phi} \left[\log \frac{p(x, z)}{q_\phi(z|x)} \right]$$

$$= \underbrace{\mathbb{E}_{z \sim q_\phi(z|x)} [\log p(x, z)]}_{\text{Maximize}} - \underbrace{D_{KL}(q_\phi(z|x) \parallel p(z))}_{\text{minimize}}$$

- 학습 단계 :
1. encoder에서 μ_ϕ 와 σ_ϕ 예측
 2. decoder에서 z 생성 ($z = \mu_\phi + \sigma_\phi \epsilon$)
 3. decoder에서 μ_θ 예측
 4. back props

- 학습 방법 :

$$\operatorname{argmax}_{\theta, \phi} \mathbb{E}_{q_\phi(z|x)} [\log p_\theta(x|z)] - D_{KL}(q_\phi(z|x) \parallel \underbrace{p(z)}_{\mathcal{N}(\mathbf{0}, \mathbf{I})})$$

1. $\frac{1}{N} \sum \log p_\theta(x|z)$, $z \sim q_\phi(z|x)$

2. 이면 $p_\theta(x|z) = \mathcal{N}(\mu_\theta(z), \sigma_\theta^2 \mathbf{I})$

3. $\log p_\theta(x|z) \approx -\frac{1}{2\sigma_\theta^2} \|x - \mu_\theta(z)\|^2$

- 한계
1. 라면 $p(z) \sim \mathcal{N}(\mathbf{0}, \mathbf{I})$ 인가.
 2. $\log p(x)$ 에 비해 미약, ELBO의 차이를 쓰지않음.

* DDPM

- loss는 denoising term : $D_{KL}(q(x_{t+1}|x_t) \parallel p_\theta(x_{t+1}|x_t))$

$$\rightarrow q(x_{t+1}|x_t, x_0) = q(x_t|x_{t+1}, x_0) \frac{q(x_{t+1}|x_0)}{q(x_t|x_0)}$$

노이즈 forward process는 가우시안 (Gaussian)

$$\rightarrow q(x_{t+1}|x_t) \sim \mathcal{N}(\mu_\theta(x_t, t), \sigma_\theta^2 \mathbf{I})$$

$$\text{즉 } D_{KL}(q(x_{t+1}|x_t) \parallel p_\theta(x_{t+1}|x_t)) \approx \frac{1}{2\sigma_\theta^2} \|\mu_p - \mu_q\|^2 + \text{const}$$

기본 골: mean predictor

- 보정

$$x_t = \sqrt{\alpha_t} x_0 + \sqrt{1-\alpha_t} \epsilon \quad \text{where } x_0 = \frac{1}{\sqrt{\alpha_t}} (x_t - \sqrt{1-\alpha_t} \epsilon)$$

$$\text{이때 } \tilde{\mu}(x_t, x_0) = \frac{\sqrt{\alpha_t}(1-\bar{\alpha}_{t-1})}{1-\bar{\alpha}_t} x_t + \frac{\sqrt{\bar{\alpha}_{t-1}}\beta_t}{1-\bar{\alpha}_t} x_0 \quad \text{and } \tilde{\sigma}_t^2 = \frac{1-\bar{\alpha}_{t-1}}{1-\bar{\alpha}_t} \beta_t.$$

$$\text{즉 } \tilde{\mu}(x_t, \epsilon_t) = \frac{1}{\sqrt{\alpha_t}} \left(x_t - \frac{1-\alpha_t}{\sqrt{1-\alpha_t}} \epsilon_t \right)$$

- Sampling flow :
1. loss 이나 2원 함수는 $D_{KL}(q(z_t|x_t) \| p(z_t|x_t))$
 2. p or q 는 각각 Gaussian 이고, ξ Gaussian 의 KL distance 는

$$2 \log \frac{1}{2} \left(\frac{\| \mu_1 - \mu_2 \|^2}{\sigma_1^2} + 2 \left(\frac{\sigma_1^2}{\sigma_2^2} - 1 - \ln \frac{\sigma_1^2}{\sigma_2^2} \right) \right)$$
 3. 2원 loss network 이고, $\sigma_{1,2}$ 는 Gaussian 이고
 μ 가 Gaussian 이고 RMSE 로 나타냄
 4. $\tilde{\mu}(x_t, x_0) = \frac{\sqrt{\alpha_t}(1-\bar{\alpha}_t)}{1-\bar{\alpha}_t} x_t + \frac{\sqrt{\bar{\alpha}_t}(1-\beta_t)}{1-\bar{\alpha}_t} x_0$ and $\tilde{\sigma}_t^2 = \frac{1-\bar{\alpha}_t-1}{1-\bar{\alpha}_t} \beta_t$.
 α_t 이고 $x_t = \sqrt{\alpha_t} x_0 + \sqrt{1-\alpha_t} \epsilon_t$ 이고
 RMSE loss μ_0, ϵ_0, x_0 이 변하는 것

- Train
1. timestep t 를 뽑고, $\epsilon_t \sim \mathcal{N}(0, I)$ 뽑고
 2. $x_t = \sqrt{\alpha_t} x_0 + \sqrt{1-\alpha_t} \epsilon_t$ 이고 x_t 뽑고
 3. $\| \hat{E}_0(x_t, t) - \epsilon_t \|^2$ 가 되 backprops.
 $\hookrightarrow$ timestep $0 \rightarrow t$ 이 missing.

- Inf
1. $\hat{E}_0(x_t, t)$ 이고 μ_t 이고
 $\rightarrow \mu_0(x_t, t) = \frac{1}{\sqrt{\alpha_t}} \left(x_t - \frac{1-\alpha_t}{\sqrt{1-\alpha_t}} \hat{E}_0(x_t, t) \right)$
 $\uparrow$
noisy input
 2. $x_{01} = \mu_t + \sigma_t z$, $z \sim \mathcal{N}(0, I)$
 $\hookrightarrow p_0(z_t|x_t)$ 이고 μ_0 !!

* Score Matching

- $\nabla_z \log p(z)$: 이걸 score 라고 하고 $p(z)$ 가 Gaussian 이고
 $\hat{=}$ score of $p(z)$

- Score of $q(z_t|x_0) \hat{=}$ $\nabla_z \log q(z_t|x_0)$

$x_t = \sqrt{\alpha_t} x_0 + \sqrt{1-\alpha_t} \epsilon_t$ 이고 $x_t \sim \mathcal{N}(\sqrt{\alpha_t} x_0, (1-\alpha_t)I)$
 $\Rightarrow$ 각각 q 를 Gaussian 으로 나타내고 보면

$$\nabla_z \log q(z_t|x_0) = - \frac{1}{\sqrt{1-\alpha_t}} \epsilon_t$$

$\hookrightarrow \epsilon_t$ 를 예측하는 것은 Score of $q(z_t|x_0)$ 를 예측하는 것과 같다!

- Tweedie's formula

: Sample 들을 몰라, data distribution의 관측 mean을 구하려고 함

$$p(x) \sim \mathcal{N}(\mu, \Sigma)$$

$$E[\mu|x] = x + \Sigma \nabla_x \log p(x)$$

given data x 에서, $p(x)$ 가 커질수록 보정된 이동.

★ Score based models → 각 모수값

: 만약 x 가 몇개 없으면, $\nabla_x \log q(x)$ 를 어떻게 구할까?

$$\rightarrow q(x_t) = \int q(x_t) q(x_{t-1}|x_t) dx_{t-1} \quad (\text{즉 } p(x_t) = p(x))$$

이때 $q(x_{t-1}|x_t) \sim \mathcal{N}(z_t, \sigma_t^2 I) \rightarrow$ Gaussian으로 정의

$$\Rightarrow E[\|s_t - \nabla_x \log q(x_{t-1}|x_t)\|^2]$$

$\rightarrow$ 즉 score를 예측하는 network 만들기

★ DDIM

$\rightarrow$ DDPM의 Markov 성질을 없애고, latent process의 marginal distribution을 유지하면서 4개의 가우시안 (x_t, x_{t-1} 이 combination인 DDPM과 동일)
 $\rightarrow$ 2개 이해한 $q(x_{t-1}|x_t) \in$ 가우시안

- 식 유도

$$q_\sigma(x_{t-1}|x_t, z_0) = \mathcal{N}(w_t z_0 + w_t x_t + b, \sigma_t^2 I) \quad \text{이때}$$

$$q_\sigma(x_{t-1}|z_0) = \int \underbrace{q_\sigma(x_{t-1}|x_t, z_0)}_{\text{이때}} \underbrace{q_\sigma(x_t|z_0, z_0)}_{\text{이때}} dx_t$$

$$x_t = \sqrt{\alpha_t} z_0 + \sqrt{1-\alpha_t} \epsilon$$

$$\text{즉 } \mathcal{N}(\sqrt{\alpha_t} z_0, (1-\alpha_t)I)$$

$$q_\sigma(x_{t-1}|z_0) = \mathcal{N}(w_t z_0 + w_t \sqrt{\alpha_t} z_0 + b, (\sigma_t^2 + w_t^2(1-\alpha_t))I)$$

$$= \mathcal{N}(\sqrt{\alpha_t} z_0, (1-\alpha_t)I)$$

$\rightarrow$ μ 와 σ 를 x 를 이용해 정리하기.

$$q_\sigma(x_{t-1}|x_t, x_0) = \mathcal{N}\left(\sqrt{\alpha_{t-1}}x_0 + \sqrt{1-\alpha_{t-1}-\sigma_t^2} \cdot \frac{x_t - \sqrt{\alpha_t}x_0}{\sqrt{1-\alpha_t}}, \sigma_t^2 I\right)$$

$$p(x) = \mathcal{N}(\mu, \sigma^2 I) \rightarrow x = \mu + \sigma \epsilon$$

$$\epsilon \sim \mathcal{N}(0, I)$$

$$p(x|x) = \mathcal{N}(x|x, \sigma^2 I)$$

$$\rightarrow z = ax + b + \sigma \epsilon$$

$$E[z] = E[ax + b + \sigma \epsilon] = aE[x] + b = a\mu + b$$

$$\rightarrow p(z) = \mathcal{N}(a\mu + b, (\sigma^2 + \frac{a^2 \sigma^2}{1-a^2}))$$

$$Var[z] = Var[ax + b + \sigma \epsilon] = a^2 Var[x] + \sigma^2 Var[\epsilon] = a^2 \sigma^2 + \sigma^2 = \sigma^2 (a^2 + 1)$$

- 차이 정리.

→ DDPM : $q(z_t | z_{t-1})$ 은 정해져있고 $q(z_t | z_c, z_0)$ 은 유도.

DDIM : $q_{\phi}(z_t | z_c, z_0)$ 은 정해져있고, $q_{\phi}(z_t | z_{t-1})$ 은 유도.

또, $q(z_c | z_0)$ 은 DDPM과 동일함 (marginal distribution)

→ DDIM은, forward 과정이 $z_0 \rightarrow z_T$ 로만 다음. z_T 로부터 z_c 를 구하는
그 다음과 비슷 $q(z_c | z_{t-1})$ 이 정해져있지 않아, $q(z_{t-1} | z_c, z_0)$ 이 정해져있지
않음!!

1. DDIM $\Rightarrow$ DDPM

2. DDIM은 $\beta = 0$ 을 통해 deterministic 하게 설정 가능

3. noise prediction network는 재사용 가능!

이러한 $\hat{\epsilon}_{\theta}(z_c, t)$ 라는 것을 예측해보자...

* Classifier Guidance / Classifier free Guidance.

- Classifier Guidance ^{class}

- goal : $p(z_c, y)$

- score function

$$\nabla_{z_c} \log p(z_c, y) = \nabla_{z_c} \log p(y | z_c) + \nabla_{z_c} \log p(z_c)$$

by classifier network.

$$= - \frac{\epsilon_c}{1 - \alpha_c} \quad \text{since } p(y) \propto N(\sqrt{\alpha_c} z_c, (1 - \alpha_c) I)$$

$$\begin{aligned} \xrightarrow{\text{score func. in noise space}} \hat{\Sigma}_{\epsilon}(z_c, y, t) &= \hat{\epsilon}_{\theta}(z_c, t) - W \sqrt{1 - \alpha_c} \nabla_{z_c} \log p_{\theta}(y | z_c) \\ &= - \sqrt{1 - \alpha_c} \nabla_{z_c} \log (p_{\theta}(z_c) p_{\theta}(y | z_c)^W) \end{aligned}$$

- Classifier free guidance

실제 적용에서는 1번 (HW) 사용

- noise perspective

$$\hat{\Sigma}_{\epsilon}(z_c, y, t) = \lambda \hat{\epsilon}_{\theta}(z_c, y, t) + (1 - \lambda) \hat{\epsilon}_{\theta}(z_c, \emptyset, t)$$

$$\begin{aligned} &= - \sqrt{1 - \alpha_c} \nabla_{z_c} \log \left(p(z_c) \left(\frac{p(z_c, y)}{p(z_c)} \right)^{\lambda} \right) \\ &\propto - \sqrt{1 - \alpha_c} \nabla_{z_c} \log (p(z_c) p(y | z_c)^{\lambda}) \end{aligned}$$

각각
생각해서
들여봐!

* ControlNet & LORA

- ControlNet : input 과 Condition 모두 input 인 경우.
- method.

1. 기본 로딩도 아예, 원본 모델과 더 생성하고, 이런 trainable 객체 설정
2. Condition은 원래 GUV를 가져, input 과은
3. Encoder layer의 접근은 원래 GUV를 가져 기본 모델의 접근과 같

↳ literally 따라하기.

- zero GUV : 1×1 GUV with 모든 pixels 0 A작

- LORA : low rank adaptation *low rank 가점*

$$\text{기원: } x^{1 \times d} \cdot W^{d \times d} = h^{1 \times d}$$

$$\text{LORA: } x^{1 \times d} \cdot W_1^{d \times k} \cdot W_2^{k \times d} = h^{1 \times d}$$

* Zero Shot Application

1. SDEdit : 생성의 과정을 거꾸로 해서 역으로 이어져 생성

2. Reprint : User가 입력한 것은 부분을 그대로 재가
